

In the Abstract

(currently amended) The present invention concerns a connection between at least one brake disc (4) and a hub (2) or the like of a disc brake. The brake disc(s) (4) is received slidable and non-rotatable on the hub (2). Each brake disc (4) is furnished with plates (3) on an inner periphery, which plates (3) have a length in the axial direction of the hub (2) exceeding the thickness of the brake disc (4).
